

CASE STUDY

Methodist Hospital System

The Business

The Methodist Hospital System directs millions of research dollars into patient care and offers the latest innovations in medical, surgical, and diagnostic techniques. It also maintains various joint programs with other large teaching hospitals in the Texas Medical Center. The Methodist Hospital is among the country's largest non-profit health care providers, and the hospital and its staff were both recognized by Best Doctors, Inc. in their annual Best Doctors in America list.

Our Solution

In order to perform routine tasks, hospital physicians were required to log in to multiple systems every day. Often the credentials needed to log in differed from system to system, causing confusion and difficulty for the medical staff. Methodist contacted Partners Consulting's Solutions Division, (formerly CPSG) for assistance in implementing and configuring one of the leading Identity, Access Management and Security (IAM) products. The selected product would also used for implementation of the medical team's single sign-on initiative.

Results

After a comprehensive review of all required business objectives, Partners Consulting facilitated architecture evaluations and assessments to determine the ideal approach for building connectors and controls. Based on findings from the assessment, the project team executed the project plan.
